# Outline

---

## □ Motivation

Deterministic vs tolerance-based design optimization

## □ Tolerance Optimization Methodology

- Multilevel LS-OPT setup
- Parameterization of LS-OPT attributes
- Extraction of failure probability as response

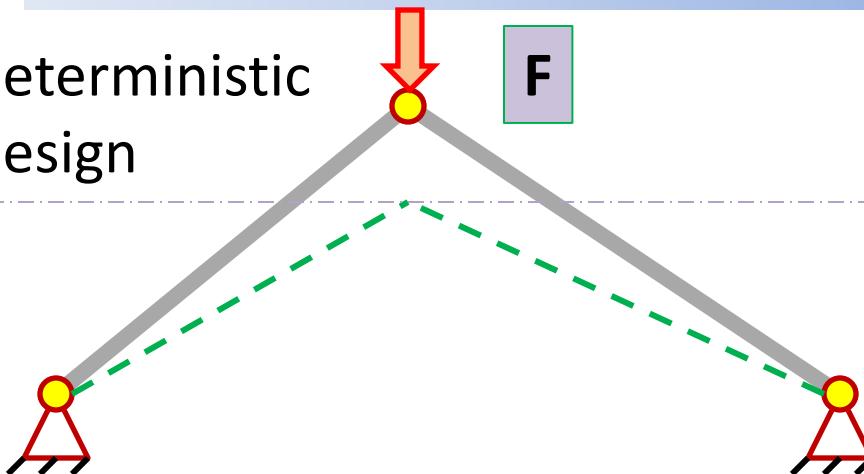

## □ Example

- Chevrolet Truck Impact

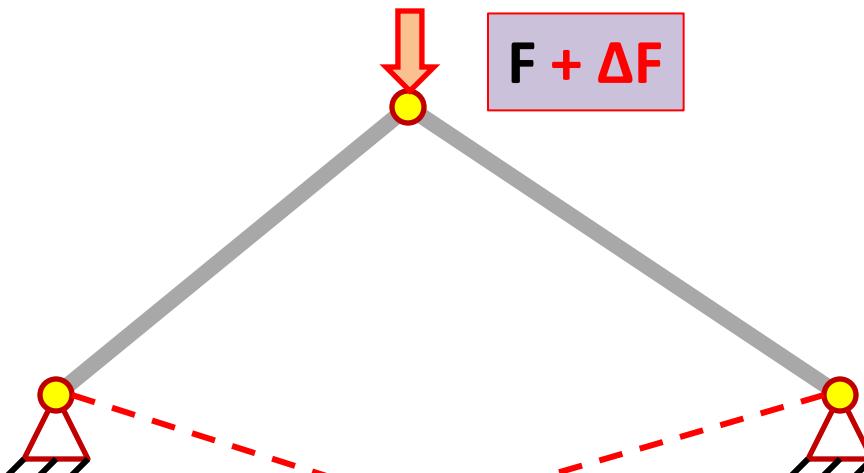

# Deterministic vs Robust Design

Deterministic  
Design

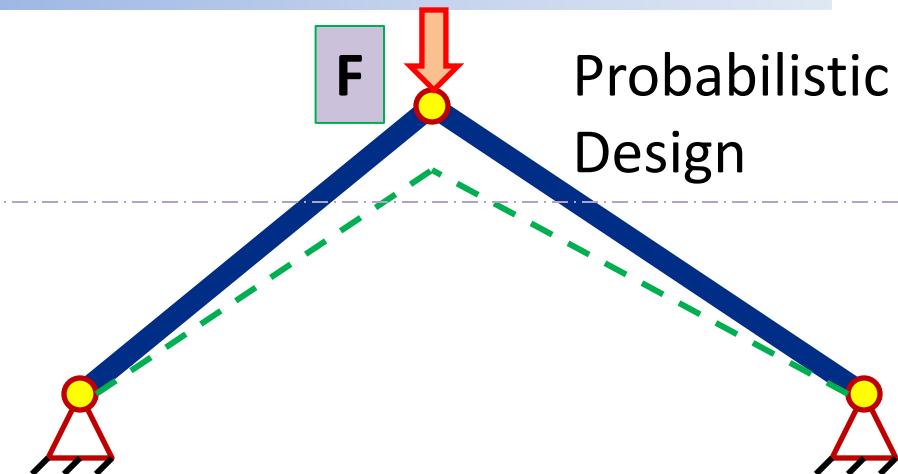

No uncertainty consideration  
- Feasible mean (deterministic) behavior

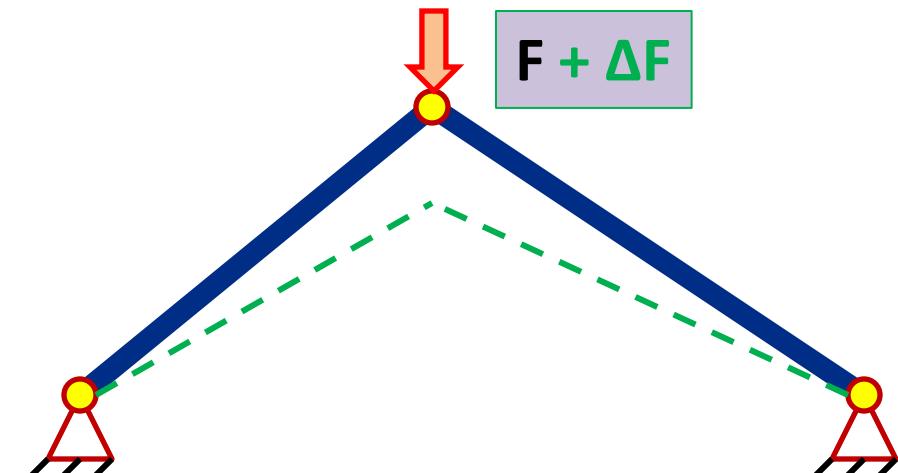

Infeasible perturbed behavior

Probabilistic  
Design

Feasible nominal behavior

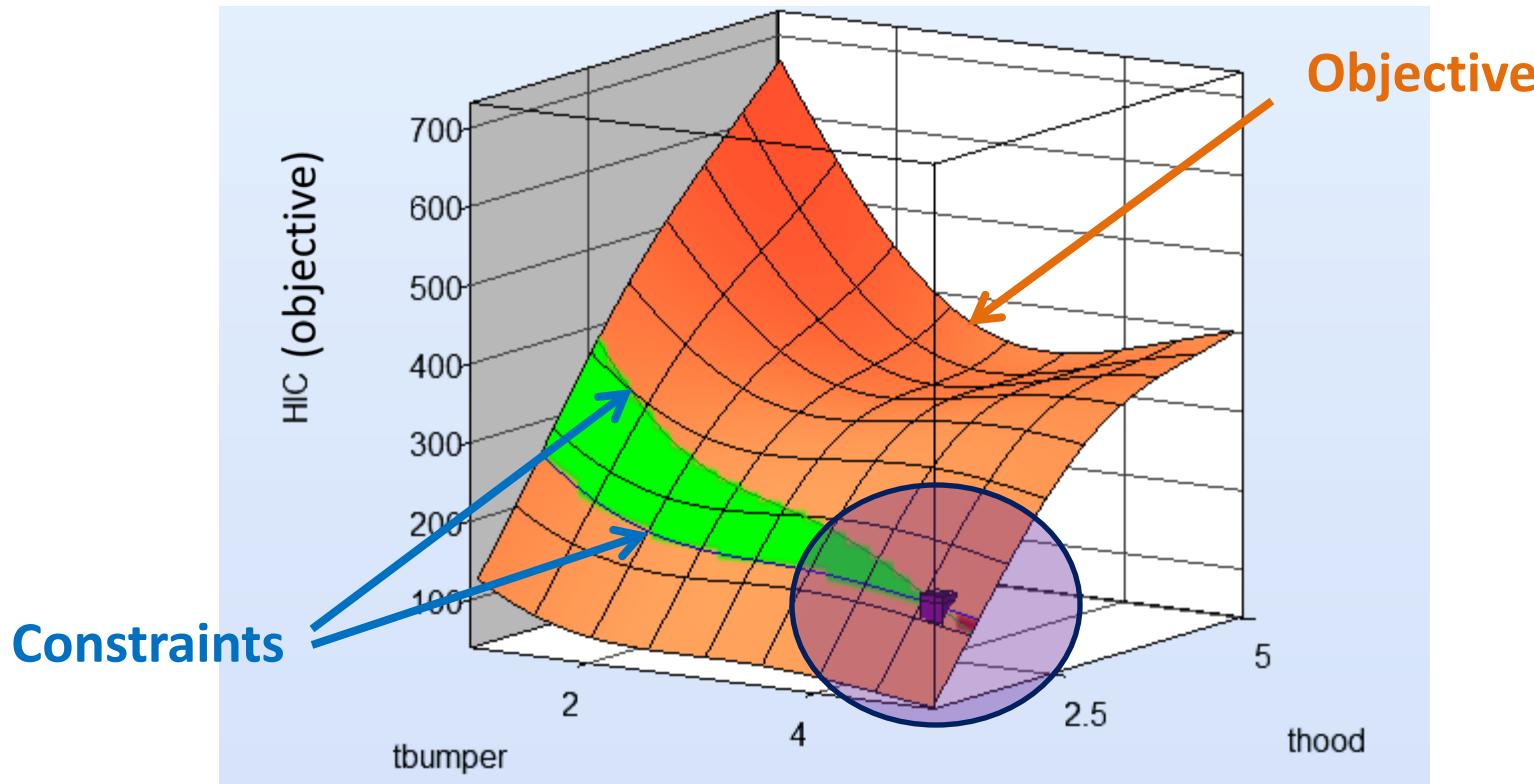

Feasible perturbed behavior

# Optimization vs Robustness/Reliability

## Deterministic Optimization:

Minimize Objective Function subject to Constraints

Optimum very often lies on the constraint boundary

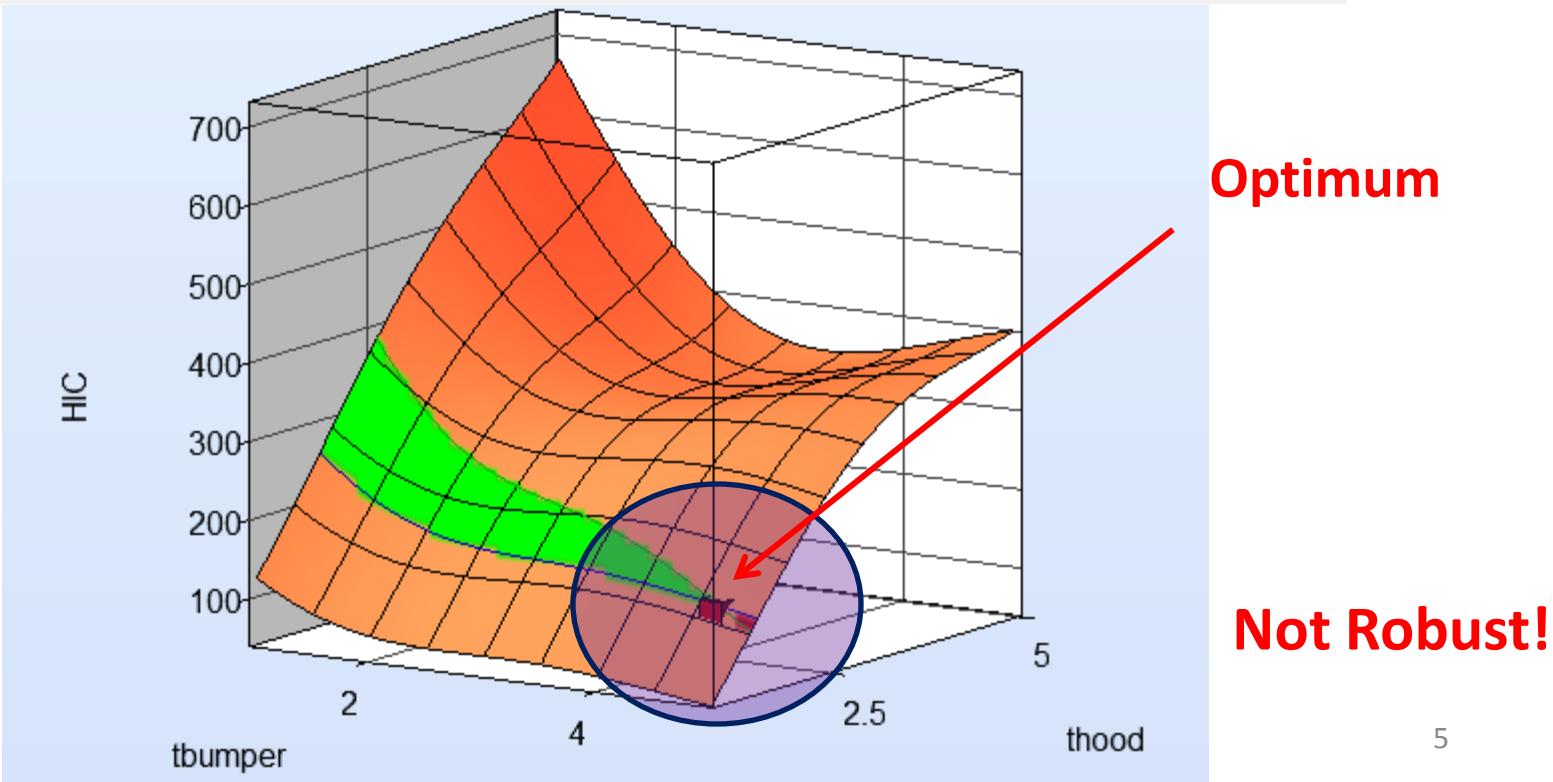

# Optimization vs Robustness/Reliability

Is the Optimum Robust??

## Sources of uncertainty:

Manufacturing imperfections, Load variations, Environment variations

Approximation/Metamodeling Error, Optimization Error, Analysis Error

# Improving Robustness of Optimum

- Reliability-based design optimization (RBDO)
  - Optimize objective function at nominal design
  - Low failure probability target
- Robust design
  - Minimize variance of the objective
- Tolerance-based design
  - Optimize nominal design variables **and tolerances**
  - Maximize tolerance
  - No failure within tolerance

Available  
as LS-OPT  
Tasks

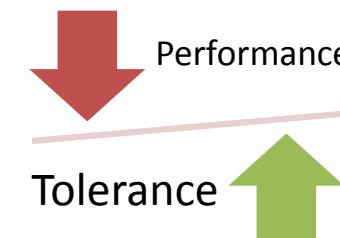

# Tolerance Optimization vs RBDO

## RBDO:

- Variables associated with distribution
- Mean variable values (distribution means) are optimized

## Tolerance Optimization:

- Variables associated with tolerance values - fixing the tolerance value similar to RBDO with truncated PDF
- Tolerances (*i.e. distribution shape*) also optimized
- Set up as a multilevel problem with parameterized inner level distribution

# Setup for Tolerance Optimization

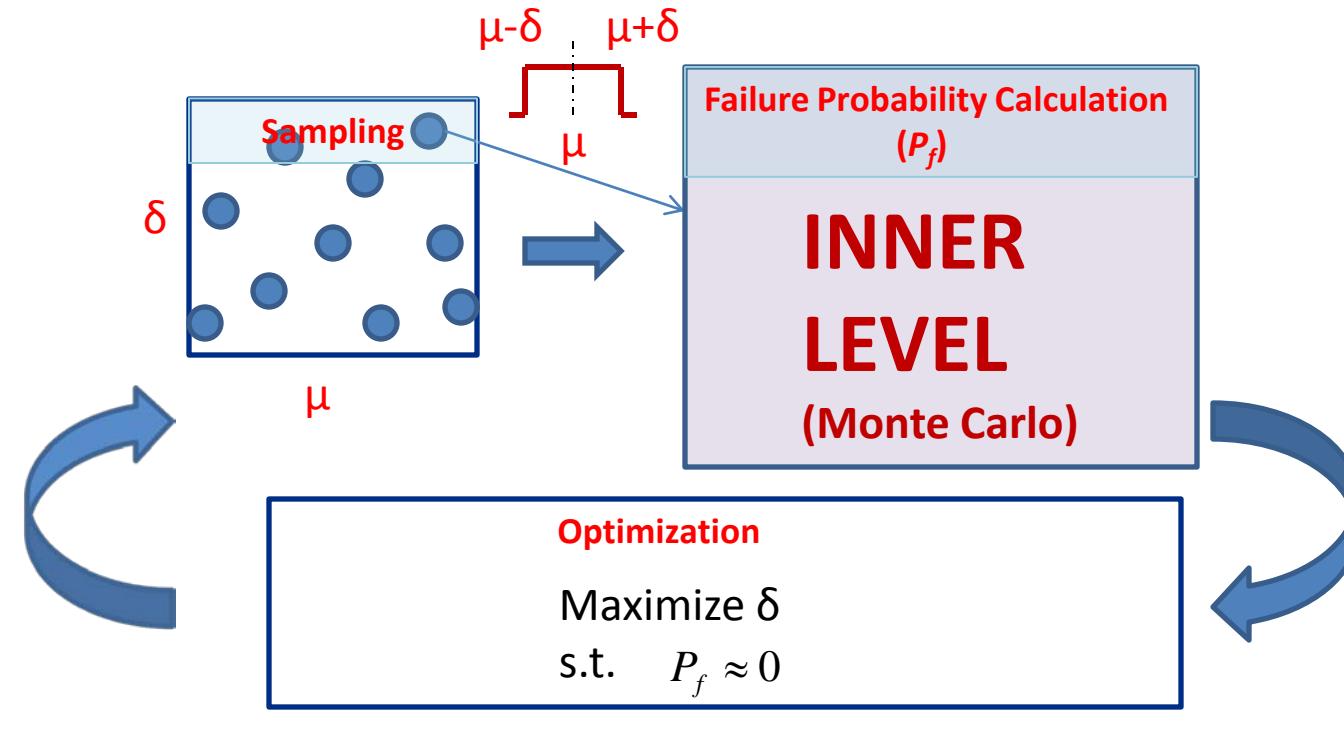

## Multilevel (Two level) Setup:

### OUTER LEVEL (Direct Optimization):

Variables: Nominal design variables, Tolerance ( $\mu, \delta$ )

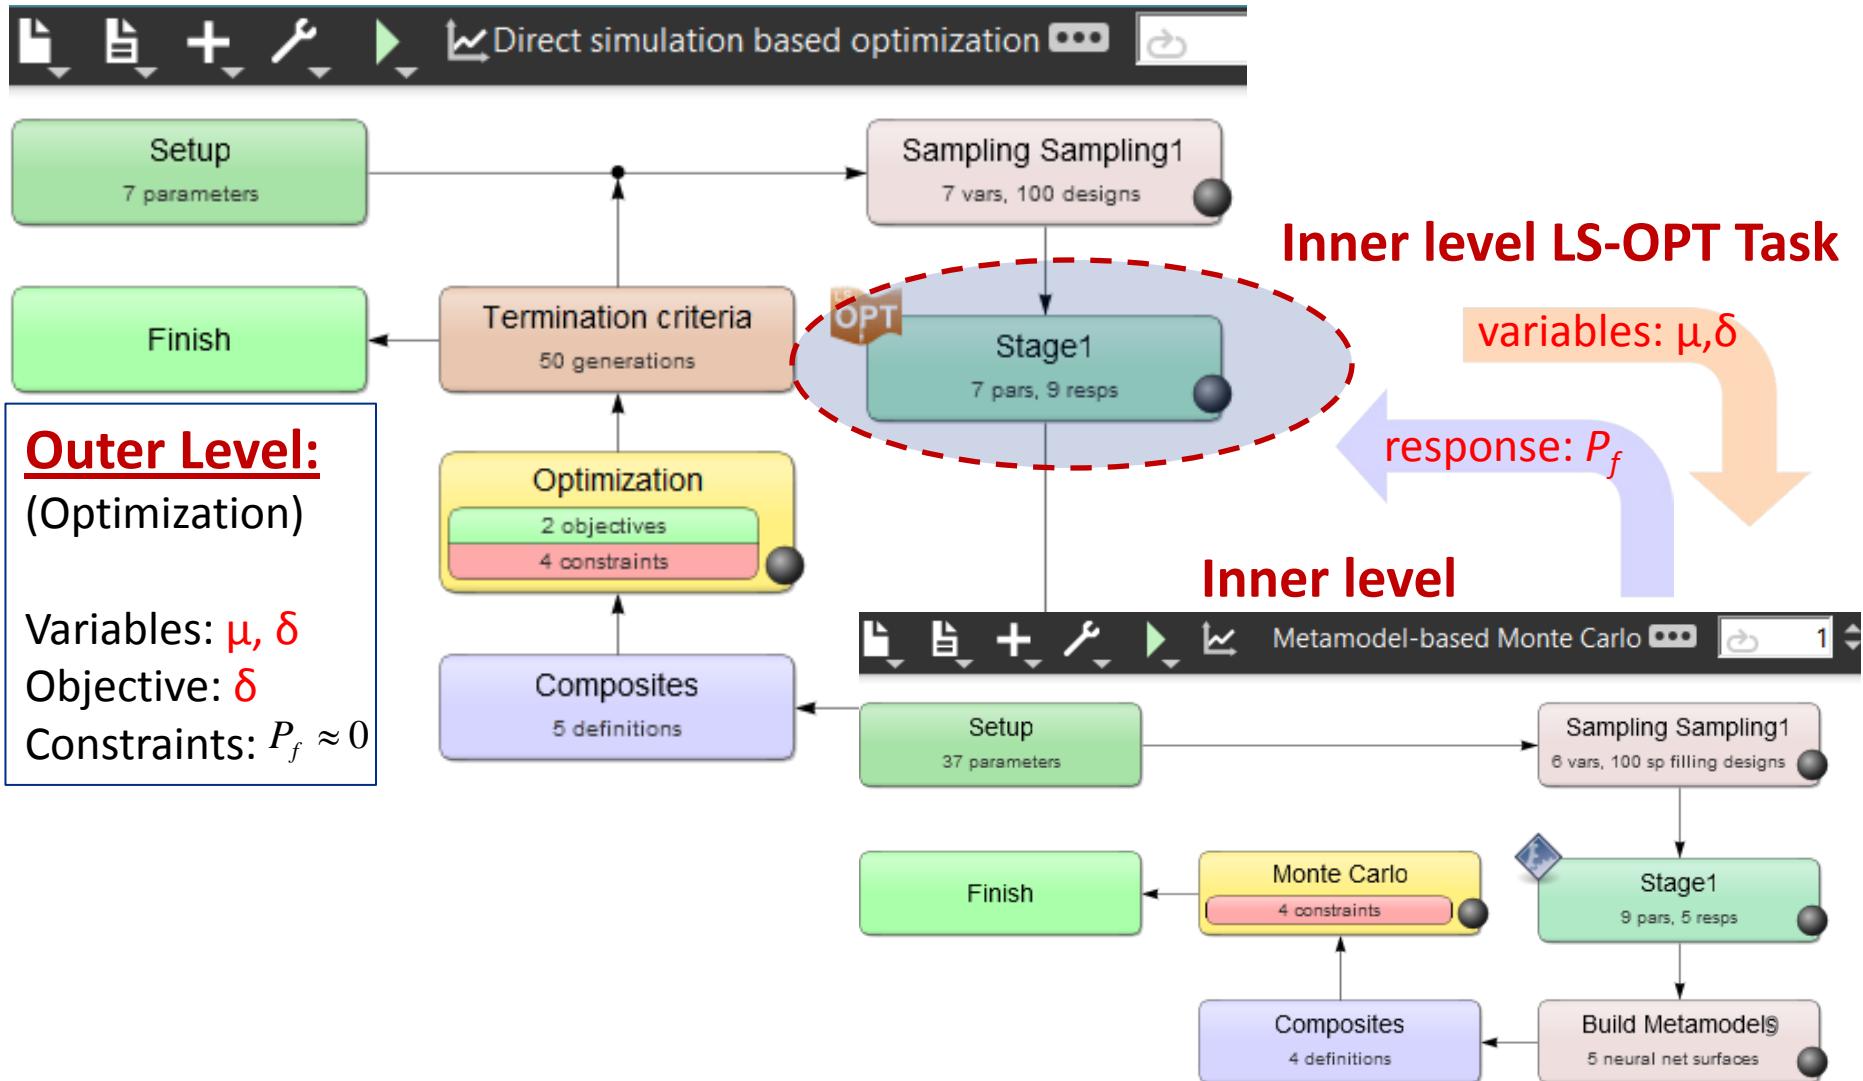

*Maximize Tolerance*

*s.t. Zero failure within tolerance interval, i.e. Failure Probability = 0*

# Setup for Tolerance Optimization

## Multilevel (Two level) Setup:

# Inner Level – distribution parameterization

**Inner Level:**  
(Monte Carlo)

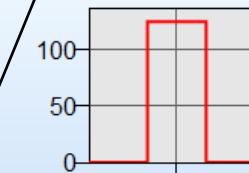

Noise Variables:  
 $X(\mu, \delta)$

From  
Outer level

- Distribution Parameterized using &
- Lower and Upper bounds based on  $\mu, \delta$

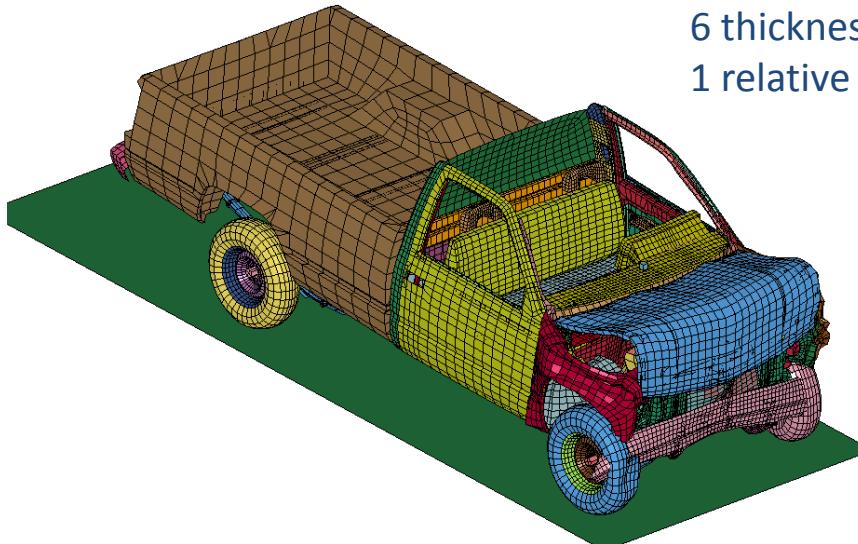

Parameter Setup					Stage Matrix	Sampling Matrix	Resources	Features

# Tolerance Optimization: Example

6 thickness design parameters  
1 relative tolerance (%) parameter

**Objectives:**

1. Minimize Mass
2. Maximize Tolerance (robust)

Expensive Analysis – Tolerance Optimization requires repeated calls!!

Two Step Solution:

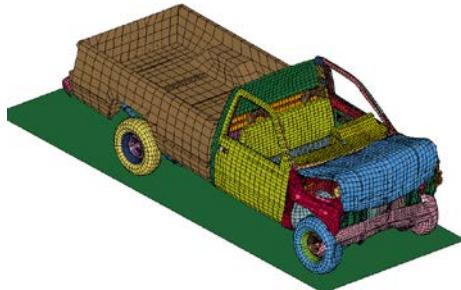

Step 1: LS-DYNA Analysis + Metamodel Construction

Step 2: Only Metamodel Evaluation

# Example

## Step 1 (Deterministic)

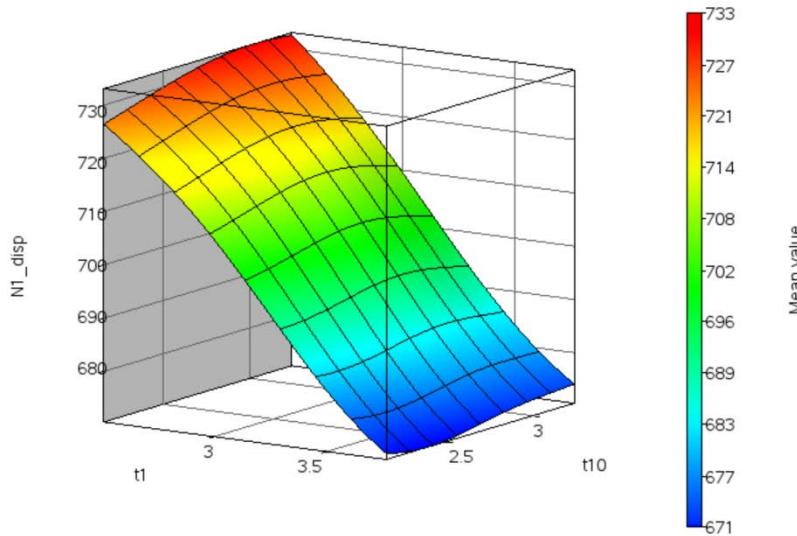

6 thickness design parameters

Objective: Minimize Mass

$$\begin{aligned} & \min_{\bar{t}_1, \bar{t}_2, \bar{t}_3, \bar{t}_4, \bar{t}_5, \bar{t}_6} && \text{scaled\_mass} \\ & \text{s.t.} && \text{scaled\_stage1\_pulse}(\bar{t}_1, \bar{t}_2, \bar{t}_3, \bar{t}_4, \bar{t}_5, \bar{t}_6) \leq 1 \\ & && \text{scaled\_stage1\_pulse}(\bar{t}_1, \bar{t}_2, \bar{t}_3, \bar{t}_4, \bar{t}_5, \bar{t}_6) \leq 1 \\ & && \text{scaled\_disp}(\bar{t}_1, \bar{t}_2, \bar{t}_3, \bar{t}_4, \bar{t}_5, \bar{t}_6) \leq 1 \end{aligned}$$

Baseline Scaled Mass: 1

Optimum Scaled Mass: 0.832

Metamodels with 1000 samples (LS-DYNA)

Analytical formula saved to file

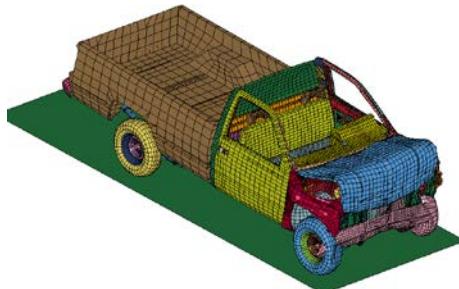

# Example

## Step 2 (Non-Deterministic)

6 thickness design parameters

1 relative tolerance (%) parameter

Direct Optimization (50 generation x 100 samples)  
7 variables

100 Samples (  $\bar{t}_1, \bar{t}_2, \bar{t}_3, \bar{t}_4, \bar{t}_5, \bar{t}_6, \delta_t$  )

Objective Functions:

1. Nominal Scaled Mass (minimize)
2. Tolerance (maximize)

$$\begin{aligned} & \max_{\bar{t}, \delta_t} \{ \delta_t, -\text{scaled\_mass}(\bar{t}) \} \\ \text{s.t. } & P(\text{scaled\_mass}(\mathbf{t}) > 0.9) \leq P_{\text{target}} \end{aligned}$$

Ensure min performance

$$P(\text{scaled\_stage1\_pulse}(\mathbf{t}) > 1) \leq P_{\text{target}}$$

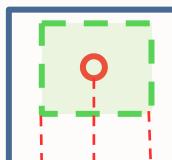

$$P(\text{scaled\_stage2\_pulse}(\mathbf{t}) > 1) \leq P_{\text{target}}$$

$$P(\text{scaled\_disp}(\mathbf{t}) > 1) \leq P_{\text{target}}$$

$$P_{\text{target}} \approx 0$$

50 times

Failure Probability Calculation

6 noise variables ( $t$ )

$$\bar{t}_1 - \delta_t, \bar{t}_1, \bar{t}_1 + \delta_t$$

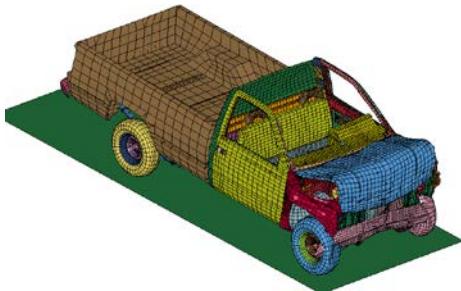

Optimization (Non-dominated points)

LS-DYNA

# Summary

---

- Tolerance optimization using LS-OPT
- Multi-level optimization, multi-objective setup
- Facilitates the search for a robust optimum
- Two different distinct categories of Pareto Optimal designs obtained for Chevrolet truck
- Future work entails simplification of the interface, allowing a single level setup that handles the multi-level nature of the problem internally
