

VIRTUAL VEHICLE DIGITAL MOBILITY

Challenge of the early virtual functional development phase of plastic parts in low-speed and pedestrian protection load cases

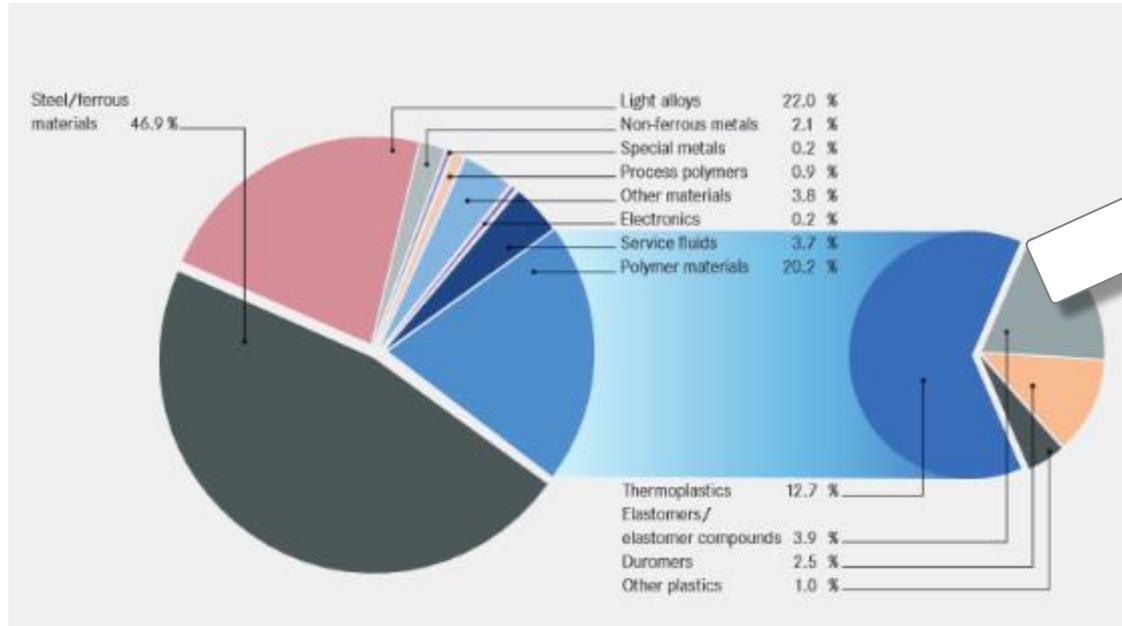

Christian Kurzböck

Geometry Meshing

Process without Supplier simulation

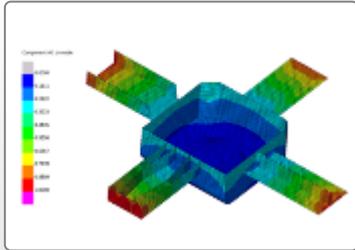

Using geometry and process information with appropriate simulation methods

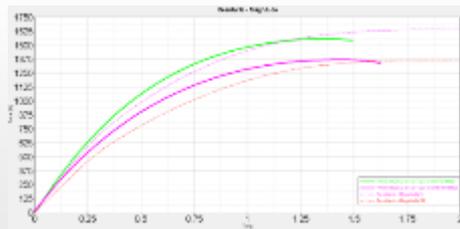

Process Information

Injection molding flow front simulation

Material Information

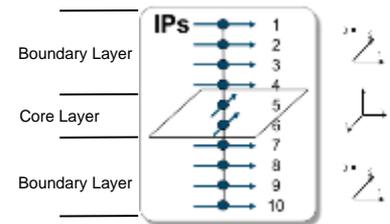

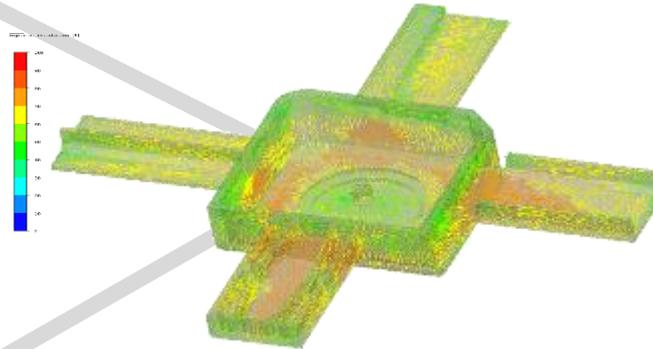

Anisotropic Materialcards

Combined in
Development Model

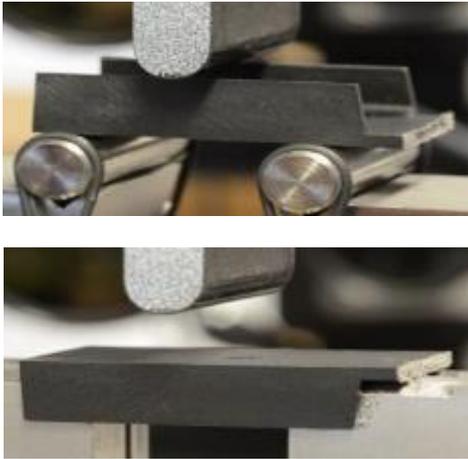

Predefined Geometric
Zones are detected and
modified

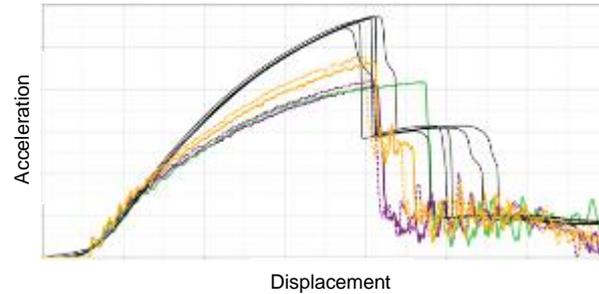

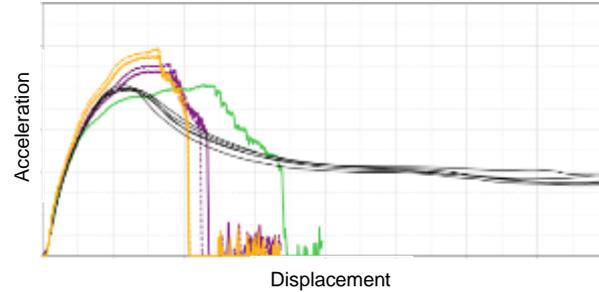

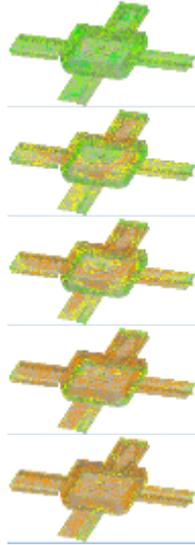

Modelling Geometry and Process Information

Test Configuration

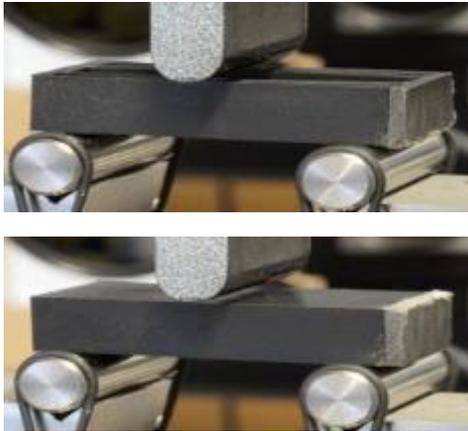

Fibre Orientation

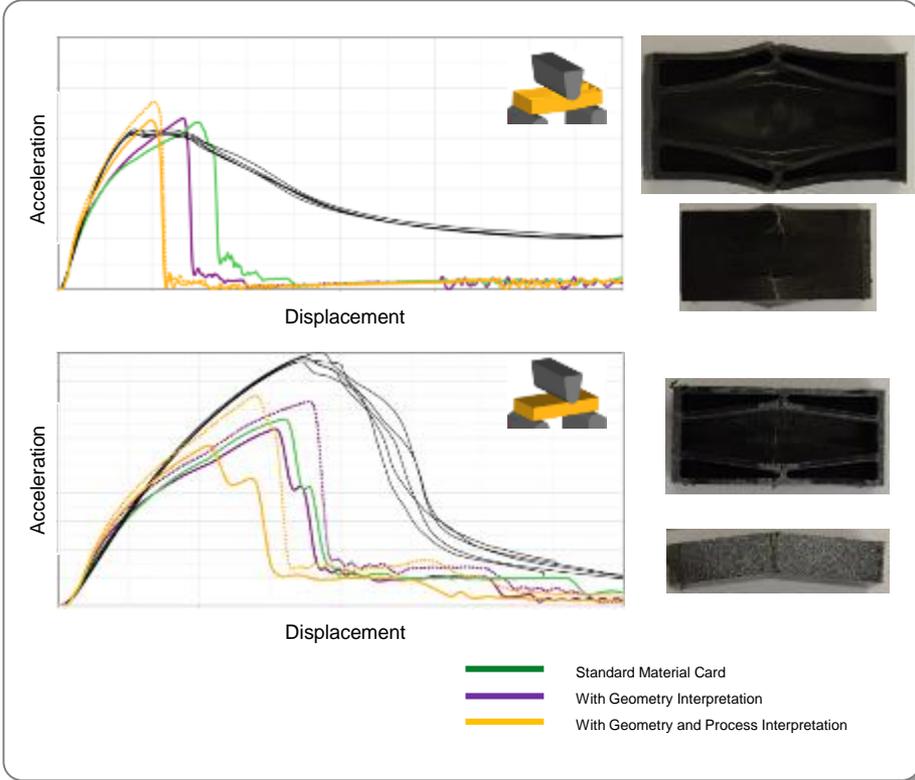

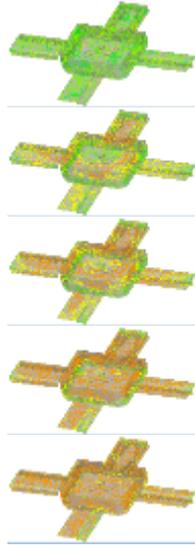

- Standard Material Card
- With Geometry Interpretation
- With Geometry and Process Interpretation

Modelling Geometry and Process Information

Test Configuration

Fibre Orientation

- Development Tool for the Early Stage
- No substitute for injection molding simulation
- As a supplement to the use of anisotropic material cards
- To take into account production-related properties at an early stage of development

Predictive simulation methods lead to **predictive Pedestrian and Occupant Safety Simulations**

This work was accomplished at the VIRTUAL VEHICLE Research Center in Graz, Austria. The authors would like to acknowledge the financial support of the COMET K2 - Competence Centers for Excellent Technologies Programme of the Austrian Federal Ministry for Transport, Innovation and Technology (bmvit), the Austrian Federal Ministry of Science, Research and Economy (bmwfw), the Austrian Research Promotion Agency (FFG), the Province of Styria and the Styrian Business Promotion Agency (SFG).

They would furthermore like to express their thanks to their supporting industrial and scientific project partners, namely Bayerische Motorenwerke Aktiengesellschaft, ZKW Lichtsysteme GmbH, Magna Steyr Fahrzeugtechnik AG & Co KG and to the Fraunhofer-Institut für Betriebsfestigkeit und Systemzuverlässigkeit LBF and Österreichische Akademie der Wissenschaften - Erich Schmid Institut für Materialwissenschaften.
